

No patient deserves a visitor like this.

The days of manually washing vials has gone away and the purchasing of sterile vials can be cost prohibitive. Due to increased attention from regulatory agencies and the need for future compliance, there is a hyper-focus on the cleanliness and sterility of vials. More importantly, microorganisms and other contaminants can be disastrous or even deadly when injected into the bloodstream of a patient. Proper and thorough vial washing is critical to ensure the safety of patients.

PennTech is a world leader of complete aseptic vial production lines. Specializing in low to medium speed machines, the focus is on simplicity, efficiency, and a compact footprint. Our machine design philosophy is "soft" rather than "hard"; servo motors rather than gears,

belts, and chains. Our mottos are "Less is more" and "Smaller is better". In doing so, we provide equipment that strictly adheres to cGMP guidelines with a very small footprint, making them easy to maintain and operate.
