

# We've got this one in the bag.

Traditional spray trigger bottles of sterile IPA are considered an open system. They allow you to spray liquid out in exchange for pulling in outside air. The alcohol is now contaminated with the outside air and is only as sterile as that environment was.

Our closed system does not allow for any outside air to come into contact with the liquid stored in the spray bottles. The inner bag simply collapses as it is sprayed out keeping the isopropyl alcohol completely sterile from first drop until last spray. This closed spray system protects your investment and the sterility of your clean room. There are other alcohols on the market and we share many similarities to them, but Truecare BiomedixUSA is your only source of closed system sterile IPA in the United States.\*

Why choose the closed system sterile alcohol?

- Elimination of ambient air extending sterility to 90 days once opened
- No contamination due to accident or lack of protocol
- Compliance with OSHA law documentation requirements
- Compliance with USP797, no refilling of bottle

Benefits:

*Sterile, pyrogen-free  
Refined through a 0.22 micron filter  
Gamma sterilized to  $10^{-6}$   
Double bagged  
Lot numbers and expiration dates  
Certificates of assurance and sterility*
