

TEMPERATURE INTELLIGENCE®

Monitoring solutions to maintain the vaccine cold chain

Get visibility into medication temperatures onsite and in transit

Keeping refrigerated medication—including COVID-19 vaccines—within the right temperature range is critical for maintaining their efficacy. That's why CDC guidelines recommend using digital data loggers to monitor temperatures as vaccines travel to patient administration sites. Temptime's S-400 electronic temperature sensors capture the temperature data you need, 24/7, while also alerting you to excursions.
