Fridge-Tag® by Berlinger

Safeguard high value vaccines and biological drugs and improve temperature record retention. Weather related power outages cause pharmacies to discard thousands of dollars in vaccines every year - Fridge-tag® is the solution.

Company Background

Berlinger, a 150+ year old company with HQ in Switzerland and operations in the USA, is a leading developer and manufacturer of electronic temperature monitors for the healthcare industry. For more than 30 years, Berlinger has been working with major drug companies to successfully monitor and protect temperature sensitive drugs shipping to patients around the world. Our mission is to produce highly accurate and reliable products that enable our customers to make immediate decisions when handling temperature sensitive products.

Product Overview

The Fridge-tag® product was developed to meet the high expectations of the World Health Organization (WHO) for monitoring vaccines stored in refrigerators around the world. The Fridge-tag® is designed to help the pharmacy properly monitor temperatures in the refrigerator. As pharmacists become more involved with immunizing patients, monitoring refrigerator temperatures is critical to insure their efficacy. Increasingly, pharmacies are also holding high value biological products for patients undergoing cancer treatments or with acute/chronic health issues. The Fridge-tag® simplifies the task of monitoring refrigerator temperatures and frees up the pharmacist/technician for more productive work. It has preset upper and lower temperature limits drawn from the vaccine guidelines published by the Centers for Disease Control (CDC). At a glance you can see if temperatures were in or out of tolerance for the past 30 days. High and low temperatures are stored for each of the past 30 days and are easily extracted from the device. This is especially helpful when technicians fill out monthly temperature logs. Also, if temperatures are too high or low, the Fridge-tag® will tell you how high/low and how long temperatures were

above/below the established guide line (35°F - 46°F / 2°-8°C). This critical information will help a pharmacy communicate with the manufacture to determine if affected drug materials can remain in circulation. Preventing one inventory loss in a typical pharmacy refrigerator can save \$2,000 - \$5,000.

Key Distribution Partner

Lake Erie Wholesale Medical Supply, Inc.

Phone: (734) 847-3847

Markets Served

- Retail pharmacies
- Infusion centers
- Doctor's offices & clinics

Price

\$75.00/ea.

Plus Shipping & Handling
