## Company Background

For almost 10 years, Synergy Medical has been providing proven and reliable technology for blister card automation, now used daily for 145,000 lives. We are dedicated to the design, manufacture, service, sale, and support of the SynMed® System. Our clients are found throughout Canada, the United States, and Europe.

Since our first installation in January 2008, there have been hundreds of SynMed® installations in retail drugstores, long-term care institutions, and in pharmacy chains that have centralized their blister card production service (Central Fill operations).

Synergy Medical software engineers are continuously working to upgrade our technology, and we work closely with each pharmacy to enable a seamless implementation. Our team is specialized in pharmacy automation, ensuring a customized turnkey solution for you.

## Product Overview

SynMed® is an automated dispensing system for solid oral medications in blister packs. It is an automated alternative to vials and pouches, that features more than 400 dispensing containers, barcode verification processes, and user-friendly software.

## Features & Benefits

### Flexibility and Versatility

- SynMed® will integrate with your existing pharmacy management software; no double data entry.
- SynMed®'s 400 containers contain 98% of all medication required. No calibration is required; supplier changes are a breeze.
- SynMed® can adapt and interchange between both single and multi-dose blister packs.
- SynMed® is compatible with over 30 (and growing) blister packs so it will easily adapt to each unique environment; that means pharmacies can automate with the blister card their patients are used to receiving.
- SynMed® will interface with your system for eMAR.

### Efficiency

- SynMed® will pick and dispense 55 doses per minute; one technician can easily produce 1,000+ multi-dose blister packs over their regular weekly schedule.
- Technician time compared to manual production will be reduced by a factor of five, and pharmacist verification time will at least be reduced in half.

### Accuracy

- The system accuracy is 99.9%, as compared to manual production where one can expect a five to ten percent error rate.
- Barcode scanning and on-screen guidance ensure secure production.
- Biometric scanning tracks responsibility.

### Unique Adherence Label

The SynMed® generated label has a number of unique, customizable features that will improve patient outcomes, and enhance customer loyalty and retention. Your pharmacy can market this output to community patients, assisted living, retirement homes, and LTC facilities, all of whom highly value these label features.

- Color coded for time of administration.
- Pictogram option for time of administration.
- Patient picture ensures medication delivery to the right patient.
- Medication images provide accuracy assurance, and facilitate change management.
- Bold, large font print further ensures proper medication adherence.

In summary, SynMed®'s flexibility with single and multi-dose card formats, 400+ containers, high production rate, and unique compliance label with patient picture and drug images, are all unique differentiators vs. other blister automation technologies.

## Testimonial

*"SynMed® transformed Rubicon Pharmacy into a highly productive operation."*

*"The team at Synergy Medical are not only selling automation, they also understand how to support us in driving adherence and improving patient outcomes."*

— Michael Wright, BSP, Rubicon Pharmacies Canada Inc.
